## **1. Introduction**

The Job finding is a prominent dynamic of information technology (IT) which offer a series of changes to seek and motivate unemployed labor forces in the labor market. The Job Finding System (Job Portal) is a modern digital platform that connects job seekers with potential employers. It replaces traditional, time-consuming hiring methods with an automated and efficient approach. Acting as a centralized hub, the system integrates key employment processes such as candidate profiling, job postings, and job requests. By matching skills with job requirements, enabling smooth communication, and providing real-time updates, it enhances the overall success of the employment process for both job seekers and organizations.

It is not a haphazard mechanism rather a procedural system with defined steps. For job seekers, the system offers a reliable way to discover opportunities, present qualifications, and track career progress. Employers and recruitment agencies benefit from a wider talent pool, streamlined applicant screening, and easy vacancy management. Administrators can also use the system to maintain accurate job records, ensure compliance with employment standards, and generate useful data for market analysis.

Job search is a systematic goal oriented, self-regulatory and motivational scheme. The idea for this system comes from challenges in traditional job markets, such as lack of information, long hiring cycles, and limited visibility for qualified candidates. To solve these issues, the system is developed with clear objectives, well-defined requirements, and strong data and process models. The development includes designing an intuitive user interface, creating secure databases, and ensuring reliability through coding, testing, and documentation. Overall, the project aims to reduce inefficiencies, strengthen connections between job seekers and employers, and empower individuals and organizations to achieve their professional goals

## **2. Problem of Statement**

The current job market creates a frustrating disconnect where talent and opportunity struggle to align. Because traditional hiring methods are outdated, both sides of the employment equation suffer from a massive waste of time and resources.

- A Broken System for Both Sides
- The Job Seeker's Burden
- The Employer's Bottleneck

### 3. Objectives

Some of the objectives in order to build the Job Finding System are as follows:

- To create a centralized platform where all job listings are available in one place.
- To provide smart job category so users only see jobs relevant to their need.
- Secure Resume Building and Profile Management.
- Data Security and Privacy Protection.

### 4. Methodology

#### 4.1. Requirements Analysis

##### 4.1.1. Study of Existing System

Several job portals currently operate in Nepal, including Himalayan Job, MeroJob, JobsNepal, Slice Jobs, LinkedIn, and Kumari Job etc. These platforms provide valuable services such as online job listings, candidate profiling, and recruitment support, primarily catering to formal, urban-based employment. For instance, Kumari Job, managed by First Job Nepal Pvt. Ltd., is one of the country's leading platforms, offering vacancies across multiple sectors such as IT, engineering, finance, education, and hospitality. Employers can post jobs, manage applications, and access HR outsourcing services, while job seekers can create profiles, upload resumes, and apply through both web and mobile applications [1].

Despite their popularity, these platforms face several limitations. They are mainly effective in urban areas and less accessible for rural populations, where people often rely on word-of-mouth, newspapers, or social media to find work [2]. Users also report issues such as low engagement from employers, lack of feedback after applications, fake or outdated job listings, and technical challenges like poor mobile optimization, slow loading speeds, and unpolished interfaces.

## 4.1.2. Requirement Collection

### 4.1.2.1. Functional Requirements

**Figure 2:** Use case Diagram of Job Finding System (Job Portal)

The Job Finding System is made to bring Job Seekers, Employers or Companies and Admins in one place.

The use case diagram shows how these three groups work with the systems functions, which helps make the process of finding a job hiring someone and managing the system easy and organized.

- \* **Job Seekers:** Job Seekers can sign up log in make a profile looks for jobs and apply for them on the platform.

- \* **Employers or Companies:** Employee can sign up log in post job openings and look over or accept applications in a way.

- \* **Admins:** Admin are in charge of the system they check company profiles manage the types of jobs make reports and keep the platform working

This way of doing things solves problems like job postings being over the place people not trusting each other and it being hard for people, in rural areas to access. The Job Finding System is a solution that saves time is reliable and easy to use for Job Seekers, Employers or Companies and Admins. It helps the Job Finding System work better for everyone. The Job Finding System makes it easy for Job Seekers to find jobs and for Employers or Companies to find the people.

## 4.2. Feasibility Study

I think the Job Finding System project is an idea. The Job Finding System project can be done on time. It will not cost too much. We can use tools and frameworks to build the Job Finding System project so we will not have to spend a lot of money to make the Job Finding System project and keep it running.

### 4.2.1. Operational Feasibility

The Job Finding System is really simple and easy to use. It works well with the hiring practices that're already in place. People who are looking for jobs will find it easy to use the system. You do not need to learn a lot to use it. The system is made to be easy and fast. It is easy, for people who are hiring and people who are looking for jobs to use. The Job Finding System helps people by saving time and making things easier when it comes to posting jobs searching for jobs and managing applications. The Job Finding System is good because it makes things easier to do. The Job Finding System does this by reducing the amount of work people have to do. The Job Finding System saves time. Makes things more efficient [3].

#### **4.2.2. Technical Feasibility**

The system works on computers and software that you can find anywhere. This makes it easy to set up and expand when you need to. You can also update the system to support features and handle more users. The system is built using web tools like HTML, CSS, JavaScript, PHP and MySQL. You can use XAMPP or a similar server on your computer to try it out. Since these tools are free and work on different types of computers the system is very compatible and flexible. This means the system is easy to maintain and improve over time making it a good choice, for a time.

#### **4.2.3. Economic Feasibility**

The system saves a lot of money because it uses open-source tools and cheap web hosting. It also has good long-term benefits. These benefits include money spent on finding new employees quicker hiring and more people to choose from. All these benefits are more important than the small costs of building and keeping the system running. The system is good value for money. It uses open-source tools and web hosting solutions. The long-term benefits of the system are reduced recruitment expenses, hiring cycles and broader access, to qualified candidates. These benefits significantly outweigh the development and maintenance costs. For both job seekers and employers, the system delivers substantial value by streamlining the employment process and improving overall organizational efficiency [4].

#### 4.3. High Level System Design (System Flowchart)

The structure and process of the Job Finding System are illustrated in the following flow

**Figure 2:** Process Workflow Chart of the Job Finding System (Job Portal)

The flowchart begins at the Start point, introducing the Job Finding System, which provides three distinct user roles: Administrator, Company, and Job Seeker. Each of these roles follows a structured workflow designed to streamline tasks while maintaining efficiency and simplicity across the system.

For administrators, the process begins with login authentication. If the entered credentials are invalid, they are prompted to try again until successful verification. Once logged in, administrators can perform core management functions such as handling company accounts, overseeing employee records, adding and maintaining job categories, and ensuring overall system maintenance. These responsibilities allow administrators to preserve the integrity, security, and smooth operation of the system. After completing their activities, administrators log out, which directs them to the end of their workflow.

Companies, on the other hand, begin by either registering as new users or logging in with existing credentials. Once successfully authenticated, they gain access to features that support their recruitment activities. They can post job vacancies, receive and review applications from job seekers, update and maintain job reports, and manage their company profiles to ensure accurate information. Additionally, they can establish communication with applicants or system administrators through the contact feature. This workflow equips companies with efficient tools to organize and streamline their hiring process from start to finish.

Job seekers also follow a similar process of either registering for a new account or logging in to the system. Once authenticated, they can search for available jobs, apply for relevant positions, and manage or update their profiles to reflect their skills and qualifications. They also have the option to check job status updates and remain informed about opportunities, while maintaining direct communication with employers or the system administrators whenever needed. By following this workflow, job seekers are provided with a smooth and accessible platform for career exploration and application management.

In conclusion, the flowchart clearly demonstrates the structured and role-based processes of the Job Portal Management System. It highlights how administrators, companies, and job seekers interact within the system, ensuring a balanced, user-friendly, and efficient environment for managing recruitment and career opportunities.

## 5. Gantt Chart

| Phase         | Starting Week | Weeks      | Duration (Weeks) |
|---------------|---------------|------------|------------------|
| Planning      | 1             | Week 1-2   | 2                |
| Analyzing     | 3             | Week 3-4   | 2                |
| Design        | 5             | Week 5-6   | 2                |
| Coding        | 7             | Week 7-14  | 7.5              |
| Testing       | 8             | Week 10-15 | 7                |
| Documentation | 2             | Week 2-16  | 16               |

This Gantt chart represents the timeline for developing the Job Finding System from August to December, broken down into different project phases. The work starts in August with the Planning phase, which lasts for two weeks and focuses on defining goals, requirements, and strategies for building the system. In September, the project moves into the Analysis phase, where the team studies system requirements, user needs, and technical specifications over the next three weeks.

By October, the focus shifts to Design, where the structure, layout, and user interface of the system are created over a four-week period. At the same time, Coding also begins in late October and continues through November and December to implement the features and functionalities of the system.

Meanwhile, Testing starts in November alongside coding to ensure that errors are identified and fixed early. Documentation runs throughout the entire project, beginning in August and continuing until December, to keep track of development progress, system details, and user manuals.

Overall, this Gantt chart clearly shows how different project phases overlap and run sequentially, helping the development team stay organized, meet deadlines, and deliver a fully functional Job Finding System by the end of December.

## **6. Expected Outcomes**

When the project is done it is a lot easier for people who are looking for jobs and for companies to find each other. People can use their phone or computer to look for jobs that're available send in their application and see what is happening with it all in one place. Companies can quickly let people know about jobs that're open look at the applications they get and find the people who are the best fit for what they need. The system makes sure that it is easy to find out about jobs that're open what skills are needed and when applications are due.

The project makes it easier for people to find jobs and for companies to find people. This means that people can find jobs that're right for them faster and it does not take as much time and work.

The project makes the whole job market better for everyone. It is easier to use, more honest and more connected which is good for people who are looking for jobs and, for companies.
